3 – PROJECT DESIGN

Introduction:

The Project Design Phase defines the overall structure, architecture, modules, database, and user interaction of the *EventForce Management System*. The purpose of this phase is to convert the requirements identified during the Requirement Analysis Phase into a clear technical design.

The system is designed to provide separate functionalities for administrators and participants while maintaining a centralized database for storing event, user, and registration information.

System Architecture:

The EventForce Management System follows a basic three-layer architecture:

1. Presentation Layer

This layer provides the user interface through which administrators and participants interact with the system.

Main components:

* Login and registration pages
* Event listing page
* Event details page
* Registration page
* Admin dashboard
* Participant dashboard

2. Application Layer

This layer contains the business logic of the application. It processes user requests and performs operations such as:

* User authentication
* Event creation and management
* Event registration
* Participant management
* Data validation
* Notifications and updates

3. Data Layer

This layer is responsible for storing and retrieving information from the database.

It stores:

* User details
* Event details

* Registration details
* Participant information
* Administrative information

Module Design:

The EventForce Management System is divided into the following major modules.

User Management Module

This module manages user registration, login, authentication, and user information.

Functions:

* User registration
* User login
* Authentication
* Profile management
* Logout

Event Management Module

This module allows administrators to manage events.

Functions:

* Create event

* View event

* Update event

* Delete event

* Manage event date, time, and venue

* Publish event information

Event Registration Module

This module allows participants to register for available events.

Functions:

* View available events

* View event details

* Register for an event

* Store registration details

* Prevent duplicate registration

Participant Management Module

This module helps administrators manage participants registered for different events.

Functions:

* View participant details

* View event-wise participants

* Track registrations

* Manage participant records

Dashboard Module

The dashboard provides an overview of the system.

Admin Dashboard:

* Total events

* Total participants

* Total registrations

* Event status

* Registration statistics

Participant Dashboard:

* Available events

* Registered events

* Event schedules

* Important updates

Database Design:

The database is designed to store and manage the information required by the system.

Main Tables

__User Table__

* User_ID

* Name

* Email

* Password

* Phone

* Role

__Event Table__

* Event_ID

* Event_Name

* Description

* Date

* Time

* Venue

* Organizer_ID

* Status

Registration Table

* Registration_ID

* User_ID

* Event_ID

* Registration_Date

* Registration_Status

The relationship between these tables allows the system to identify which users have registered for which events.

User Interface Design:

The user interface is designed to be simple, responsive, and easy to navigate.

Main Screens

1. *Home Page* – Displays the purpose of the system and available events.

2. *Registration Page* – Allows new users to create an account.

3. *Login Page* – Provides secure access to the system.

4. *Event Listing Page* – Displays available events.

5. *Event Details Page* – Shows complete information about a selected event.

6. *Registration Page* – Allows participants to register for an event.

7. *Admin Dashboard* – Allows administrators to manage events and participants.

8. *Participant Dashboard* – Allows users to view and manage their registrations.

System Workflow:

The basic workflow of the EventForce Management System is:

User Registration → Login → View Events → Select Event → View Event Details → Register → Registration Stored in Database → View Registration Status

For administrators:

Admin Login → Dashboard → Create/Manage Events → View Registrations → Manage Participants → Monitor Event Information

Security Design:

The system includes basic security measures to protect user and system information.

* Secure user authentication

* Role-based access for administrators and participants

* Input validation

* Protection of user credentials

* Restricted access to administrative functions

* Proper database access control

Expected Outcome:

The Project Design Phase provides a clear blueprint for developing the EventForce Management System. It defines the system architecture, modules, database structure, user interface, workflow, and security requirements.

This design will serve as the foundation for the *Implementation/Development Phase*, where the planned modules and functionalities will be developed and integrated into the working system.
